- Podcast interviews with top people

Specific skills

- Financial modelling

- Accounts analysis

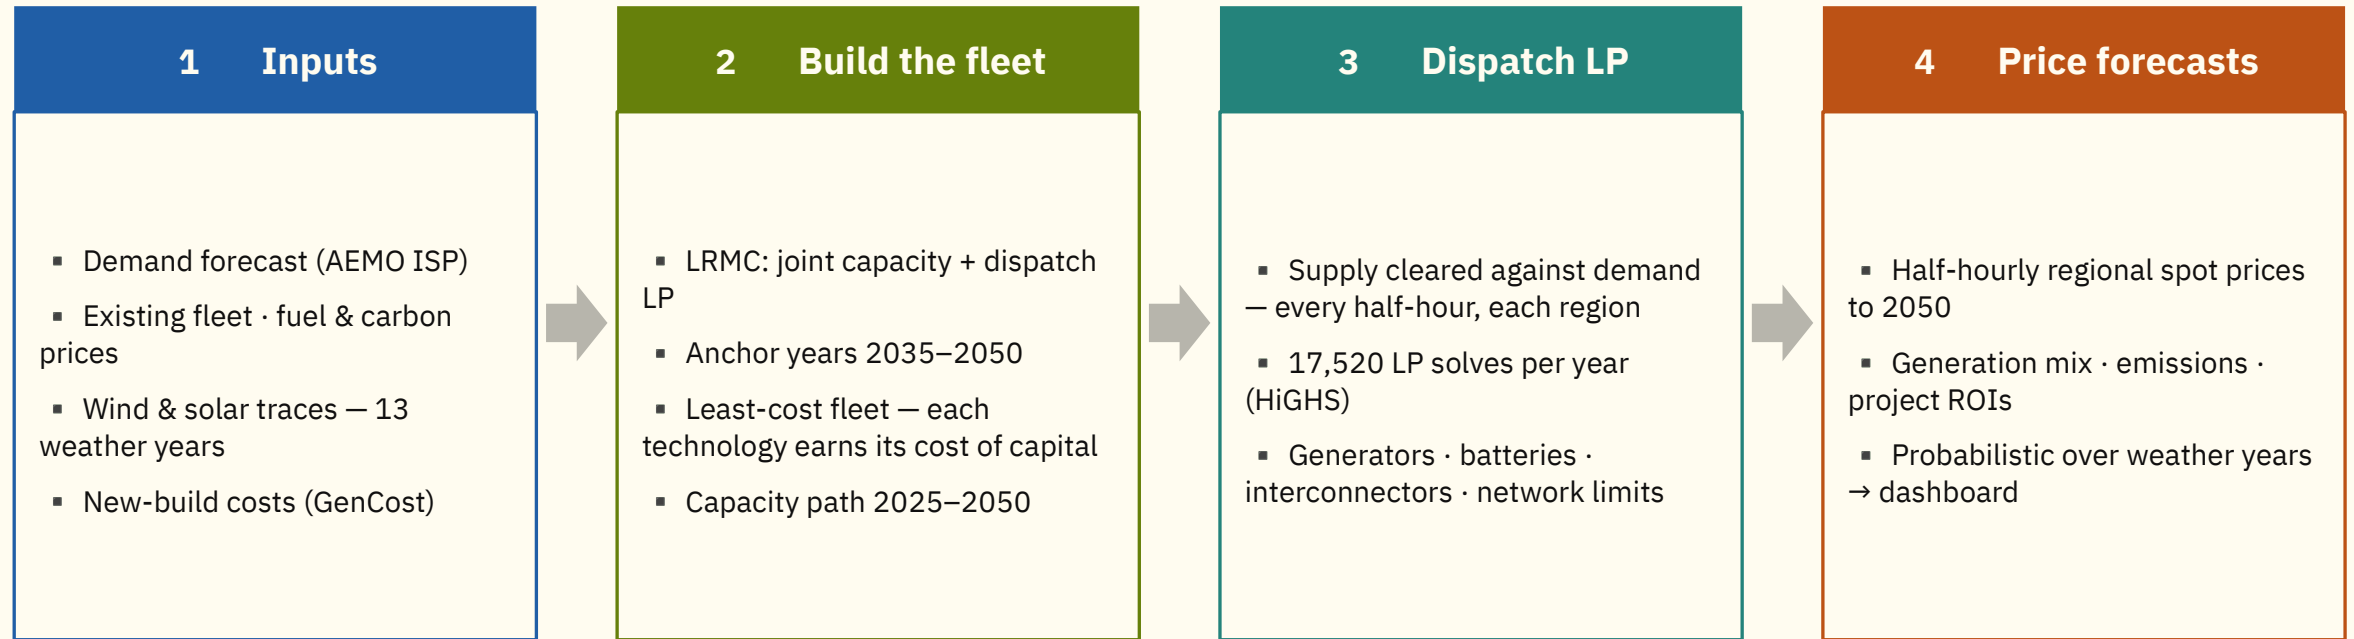

- Cost of capital

- Python / vibe coding

- Access to lots of data and dashboards

How the spot-price forecast works

A dispatch-interval LP model of the National Electricity Market · all five regions · 2025–2050

Spot prices emerge as the **dual (shadow) prices** of each region's supply = demand balance — the same price-formation mechanism as **AEMO's NEMDE**.

Let's talk
